

VACCINE BLOOD SUPPLY

Dr. Ryan Cole on whether the blood supply is safe: "We don't know"

The parents of Baby Will are right to insist on unvaccinated blood. The safety of the blood supply is unknown. We have a medical community which is not trustable on anything vax related.

Dr. Ryan Cole: “We don’t know.”

Executive summary

The medical community is still not seeing any connection between the vaccine and deaths. They don’t acknowledge the relationship except in a few rare cases. This is all willful blindness. So why should we now believe them with respect to the safety of the blood supply from vaccinated people?

Until the medical community starts acknowledging the vaccines are unsafe, their assurances of safety with respect to anything vaccine related should be highly suspect.

In the case of the safety of the blood supply, US pathologist Ryan Cole has a message, “We don’t know.”

Dr. Ryan Cole on the safety of the blood supply

I asked Dr. Ryan Cole what he thought about the integrity of the blood supply. I asked him the same question the [dentist in Marathon Man asked](#): “Is it safe?”

Here is his verbatim response:

We don’t know.

Nobody knows. I have clots from unvaccinated deceased that were transfused and formed large clots post transfusion and died.

No blood bank is checking.

“One cannot find, that for which they do not look”.

This is akin to blood banks and hemophiliacs and HIV in the 1980s. It may not be a problem. However, it may be. There are assays academically available to check for circulating spike protein. It is criminal negligence to not assure the safety of the blood supply based on bureaucratic declarations without scientific explorations.

The bottom line is that Baby Will’s parents are correct. They have made a responsible decision and their decision should be respected by the medical community.

A “Message from Michael” from just over a year ago

Just over a year ago, I wrote about [the untimely death of Mike Granata on my Substack in a post entitled “A message from](#)

Michael” (not to be confused with the song by Dionne Warwick entitled “*Message to Michael*”).

One of my readers just now mentioned his death in the comments of my last Substack article.

Michael’s key message was that the medical community has been hiding the vaccine deaths and deliberately looking the other way. They know it is happening, but if they speak out, they will lose their jobs. They asked him to deliver the message to the public so they would not be fired.

Since the start of the vaccination program nearly two years ago, nothing has changed. The medical community is still hiding all the COVID vaccine safety issues today, a year later.

Until there is an admission from the medical community about these deaths and severe adverse reactions, their advice on matters related to the safety of these vaccines should not be considered to be reliable.

Baby Alex: they deleted the hospital records of that death post-transfusion

Sacred Heart Hospital in Washington State has erased all records of the death of baby Alex who died from a blood clot after receiving a transfusion from a vaccinated patient.

So there is no evidence of a problem anymore. They erased it, just like the CDC erased all data linking vaccines and autism. This is how science works nowadays.

Summary

Whatever happened to the precautionary principle of medicine?

In my opinion, this isn't a close call. We can't know today if the blood supply is safe because nobody wants to even ask the question and do the experiments required to answer it.

For that reason, Baby Will's parents' request to use unvaccinated blood should be respected.
